

SEINON ACCOMPANYING YOU IN ALL THE STEPS TO SAVE ENERGY:

STEP 1:
MONITORING

Understanding and analysing energy consumption at all times through use of charts and graphs.

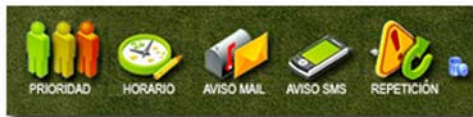

SEINON can get online, using web technology and without any software installation needed, multiple graphics, consumer records and tables of various electrical parameters of the facility, to offer comprehensive energy advice.

STEP 2:
ALARM MANAGEMENT

Controlling what happens at the facility and alerting of incidents by programming alarms.

To warn of incidents, SEINON allows control of the facility by automated alarm management through .mail and sending text messages to mobile phones (SMS) 24h. This will allow the person responsible for monitoring and diagnostics of the installation, total awareness of what happens in electricity consumption as you are able to schedule an unlimited number of alarms for all the electrical parameters processed by SEINON.

STEP 3:
REMOTE CONTROL

Intervening on installations remotely through the activation and deactivation of actuator elements.

There you are able, for example, to enable or disable your installation machines without the need to physically be there.

This activation and deactivation of relays may be associated with remote alarms or events can also be done manually from the website of SEINON

STEP 4. DECISION MAKING
VIRTUAL ENERGY ADVISOR (AEV)

NEW

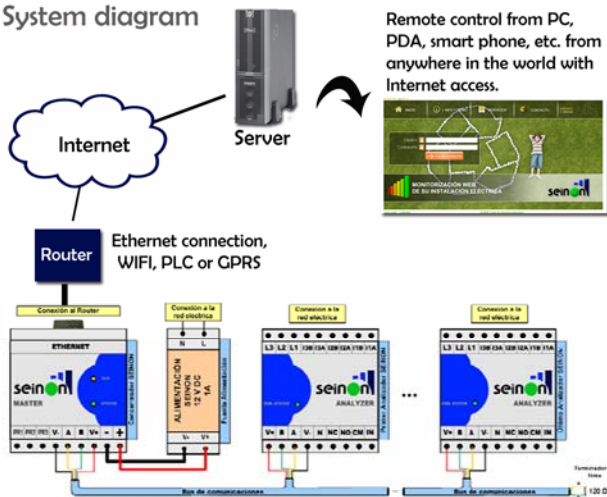

The system includes the revolutionary SEINON Smart Advisor.

This intelligent advisor interprets the monitored data to make recommendations whether savings through changes in supply contracts or through actions on the installation.

This intelligent system advises the following functions:

- Calculate installation costs (contracted rate and measured data).
- Choose appropriate contract.
- Notice of anomalies in the system (excess reactive power inadequate recruitment, etc.).
